

Slimline Elbow EB2040-00

Single Patient Use Only

Rx Only

Important Information

Read carefully and completely before applying.

Intended Use

This elbow brace provides elbow immobilization or range of motion limitations as prescribed by a medical practitioner. It may be used post injury, post-operatively or throughout rehabilitation.

Precautions

Consult your medical professional immediately if you experience sensation changes, unusual reactions, swelling or prolonged pain while using this product.

Directions for Use

1. Remove the elbow brace from package. Remove single hex screw located on brace hinge with hex tool. This will allow clear plastic cover to slide.

Adjust the hinge setting by rotating the clear cover until the desired flexion or extension pins are exposed. Remove the pin from its position and place it in the desired flexion or extension setting. Rotate the clear cover again to cover the flexion and extension pins. Reinsert hex screw using hex tool.

2. Remove foam biceps wrap and forearm wrap from inside of brace.

3. Position the biceps and forearm wraps on patient so that the hook-and-loop closure is located

on the anterior (front) surface of the arm. Trim excess material to allow approximately 2" overlap.

4. Position the brace so that the hinges are aligned with the center of the elbow joints of the arm.

5. With the hinge settings aligned properly, begin attaching the hook-and-loop closure straps. First attach the strap directly above the elbow. Next attach the strap just below the elbow. Finally attach the strap closest to the shoulder followed by the strap closest to the hand.
